

Biosecurity Laboratory

January 6, 2010

Based on the results of this study, the Continuous Infectious Microbial Reduction (CMR[®]) system has the potential to reduce sources of microbial contamination in health care and other indoor air environments. This technology is effective at reducing populations of Methicillin resistant Staphylococcus aureus and Listeria monocytogenes on stainless steel surfaces.

The active antimicrobial in the CMR[®] System is Vaporized Hydrogen Peroxide. The system does not produce measurable levels of ozone.
